

Final Project

Design a database system for the university, which contains the information of students (identified by student ID) and courses (identified by course ID). Students also have student names. Courses have a course name and the number of credits. Students enroll in courses.

Task 1: Database Design

Relational Schemas

```
STUDENT(  
    StudentID INT PRIMARY KEY,  
    StudentName VARCHAR(100)  
)
```

```
COURSE(  
    CourseID INT PRIMARY KEY,  
    CourseName VARCHAR(100),  
    Credits INT  
)
```

```
ENROLLMENT(  
    StudentID INT,  
    CourseID INT,  
    PRIMARY KEY (StudentID, CourseID),  
    FOREIGN KEY (StudentID) REFERENCES STUDENT(StudentID),  
    FOREIGN KEY (CourseID) REFERENCES COURSE(CourseID)  
)
```

E/R Diagram

STUDENT: stores each student's ID and name.

COURSE: stores each courses ID, Course name and number of credits

ENROLLMENT: implements the many-to-many "students enroll courses" relationship by linking StudentID and CourseID
